

ISOPA and its Member Companies Commit to Climate Neutrality 2050

With the European Green Deal, the EU aims to become climate-neutral by 2050. This objective to become an economy with net-zero greenhouse gas emissions means that all members of society will have to play a role, including the producers of diisocyanates and polyols.

The transition to a climate-neutral society represents an opportunity for the chemical industry. ISOPA and its member companies share this vision and are committed to the Chemical Strategy for Sustainability and the Circular Economy. The industry makes great efforts to implement these projects and to boost innovation in order to lead the way toward a carbon-neutral society. To deliver on these ambitions by 2050, ISOPA's member companies have launched a series of initiatives with the value chain to move from a linear model toward a circular model. These initiatives include the use of recycled and renewable resources and recycling technologies to minimize waste and reduce emissions.

By pursuing this path with commitment and consistency, ISOPA and its member companies will help deliver the Green Deal ambitions for a more sustainable planet and a safer society.
